Supportive text to represent a cover letter.

To whom it may concern.

Some people want to see a cover letter. I am a consultant with broad experience dealing with advance analytics implementations more or less since 2019. You can imagine from I am trying to figure out what the cloud is... up to I have petabytes of data in my data base.

I am a person who is able to understand volumetry in data. I am able to identify processes where I can tell if we can still use forever regular python or you need to put this into a distributed alike platform aka something able to crunch big data otherwise you will cry in a couple of months. I can translate business needs into artificial intelligence solutions.

I work for some companies and projects and had the opportunity to work in MLops implementations and advance analytics applications to generate proper production code. No, I am not the type of person who puts the keys in the production code. I am aware of the importance of using a proper config file while working with implementations in production level. Yes, I had heard sad stories of codes from companies leaked with the keys and sad people crying at management level because important information from user got leaked.

I had more experience working with AWS, Dataiku, Hadoop, Spark, SQL and Snowflake. Why should you hire me? I am really cool person, responsible, no gossips, no inappropriate behavior at the office, healthy comments and jokes from time to time, very good at documenting my job, honest and I do beautiful code (Clean and with comments for future generations). What I do with my free time? Exercise, ukulele playing, now switching to guitar, electronic music lover, rock concerts, I speak several languages and I like to hang out with people. Last but not least, I am good at speaking out when something goes bad, and I am good at do not exposing other people with embarrassing situations.

Now, hire me!

Benazir de la Rosa
